

## MINERALISED EXTENSIONS DEFINED AT SUKARI AND REGIONAL EXPLORATION COMMENCES

Results have been received today for RCD1073 drilled to test the down dip extension of the porphyry in the Amun zone. Significantly this hole intersected an extremely wide zone of mineralization of **197m @ 2.18g/t gold** and within this was a higher grade core of **100m @ 3.51g/t gold** (Figure 1). This mineralized intersection sits outside of the current optimized pit shell and also outside of the previously announced resource of 9.01moz.

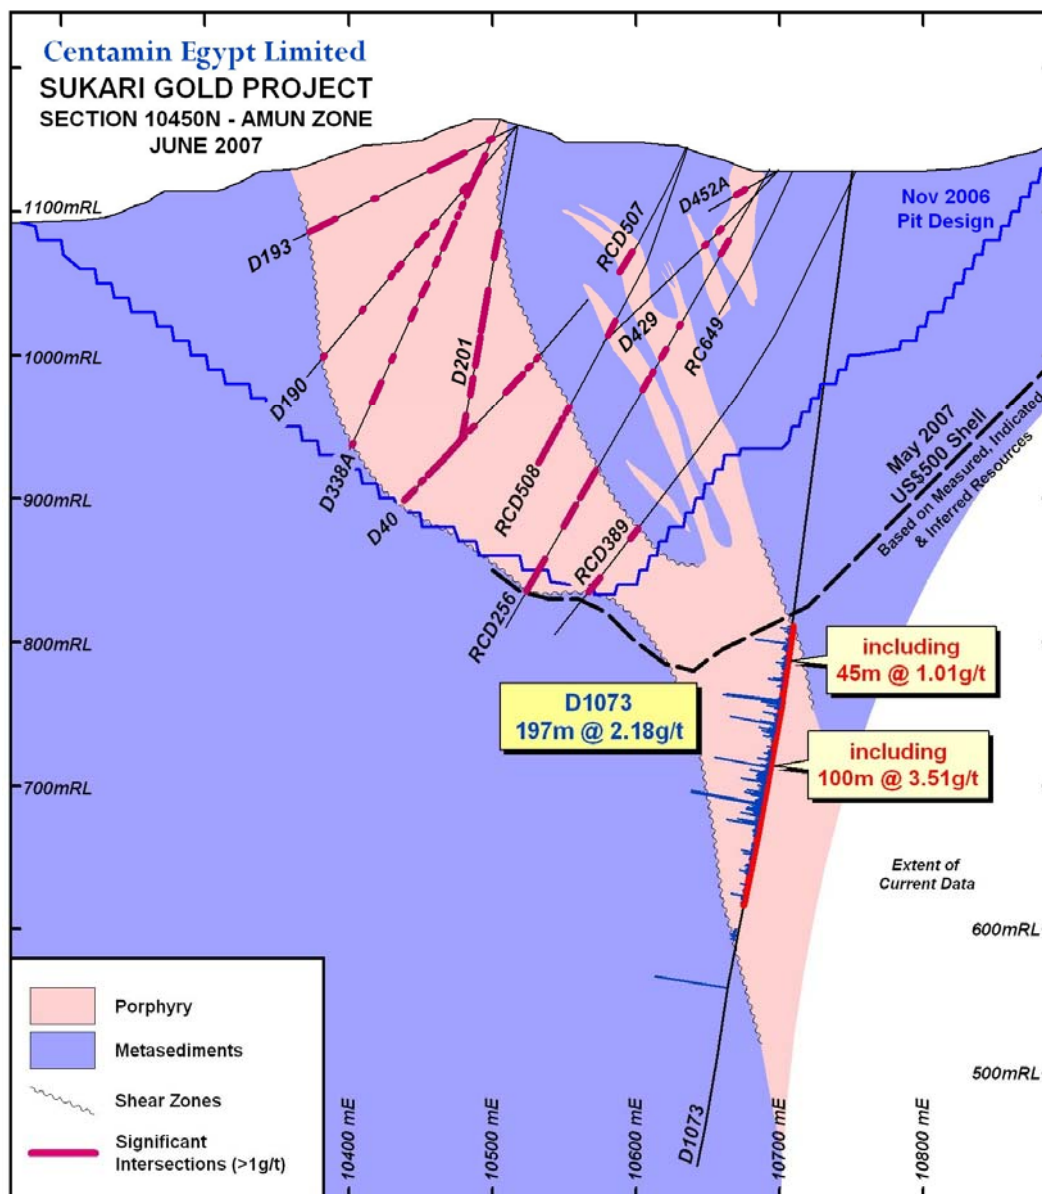

Figure 1

The current drilling in the Amun zone was designed to deepen the previous open pit optimizations which had bottomed on drilling data rather than a lack of mineralization or pit economics. Previous geological interpretations were also limited in this area by a lack of drilling and this vastly mineralized intersection will now lead to more drilling being planned in this area which will clearly lead to further significant resource growth.

The current focus of drilling on the Sukari hill is most easily seen from Figure 2.

### Regional Exploration Commences

Within the 160km<sup>2</sup> Sukari Mining Lease exists several areas of great interest for modern gold exploration. Several of these areas have hosted prior production during the Pharaonic, Roman and British mining efforts through Egypt's history. Work has now commenced on several of these near mine prospects with initial mapping, rock chip sampling and trenching to be followed by drilling. Mapping and rock chip sampling is currently underway at the Student, Pincer, Roman Garrison and Mike prospects. These prospects take the highest priority due to their proximity to the imminent mining operations.

The Company is extremely pleased with the latest drill result from the Amun Zone. Our previous interpretations, based upon limited drilling at depth, suggested that the porphyry hosting the gold mineralisation was thinning, however this latest drilling indicates this is not the case. The significance of RCD1073 cannot be underestimated as we anticipate further drilling will continue to define significantly more ounces in the Amun zone than initially expected.

Drilling continues with 9 rigs on the Sukari site.
